

AWS Certified DevOps Engineer - Professional (DOP-C02): Introduction

Introduction

Course Introduction

Hello, everyone. My name is Craig Arcuri, and welcome to my course, AWS Certified DevOps Engineer - Professional Exam Prep. I am a senior training architect at Pluralsight. This course will prepare you to take and pass the AWS Certified DevOps Engineer Professional exam. The course will dive deep into the six domains on the exam, and we'll use many hands-on labs and demonstrations to fortify your knowledge on key exam topics. While the focus of the course is to pass the exam, the hands-on nature of the course will serve the student well, in real-world DevOps situations. A heavy emphasis will be placed on SDLC automation, as well as configuration management and infrastructure as code. The course will have module quizzes and three full practice exams which are designed to give the student an exam experience representative of the exam they will encounter from AWS. It is important to review your exam results, focus on areas of weakness, and turn those weaknesses into strengths. Retake the exams as needed to ensure you are thoroughly prepared for the actual exam. Some of the major topics that we will cover include the six exam domains, SDLC automation, configuration management, and infrastructure as code, resilient cloud solutions, monitoring and logging, incident and event response, and security and compliance. Main areas of focus include CI/CD pipelines, configuration management, and automation chains using services such as Lambda, EventBridge, and SNS. By the end of this course, you will have the necessary skills to pass the AWS Certified DevOps Engineer Professional exam, as well as the skillset to work as an AWS DevOps engineer. There's no prerequisite AWS certification requirement to take the exam, but it is highly recommended to have one or more associate-level certifications. From here, you should feel comfortable diving into AWS with courses on the AWS Developer Tool suite, serverless concepts with Lambda, and AWS CloudFormation and the AWS CDK. So I hope you'll join me on this journey to learn AWS DevOps with the AWS Certified DevOps Engineer Professional Exam Prep course, at Pluralsight.

About the Exam

Hey Cloud Gurus. Welcome to this lesson about the AWS Certified DevOps Engineer Professional exam, otherwise known as DOP-C02. So in this lesson, we'll talk about the expectations you should have for the exam and set the stage for

how we're going to prepare for the exam. Alright, let's take an overview look at the exam. So the exam validates a candidate's technical expertise in provisioning, operating, and managing distributed systems and services on AWS, the ability to implement and manage continuous delivery systems and methodologies on AWS, we're thinking CI/CD concepts, implement and automate security controls, governance processes and compliance validation, and that will entail a mastery of a lot of security services such as GuardDuty, Inspector, Security Hub, define and deploy monitoring, metrics, and logging systems on AWS, then CloudWatch, Eventbridge, and specifically, CloudWatch logs and CloudWatch metrics. Implement systems that are highly available, scalable, and self-healing. Think about autoscaling, load balancing, Route 53. Design, manage, and maintain tools to automate operational processes, and we want to create automation chains using services such as Lambda and SNS, and Eventbridge. Let's talk about some exam specifics. So the exam length is 180 minutes. That's a 3-hour exam. Make sure you stay hydrated. Cost \$300 with a caveat that if you've taken previous exams, you may have an exam discount voucher. Format is multiple choice or multiple response, mostly multiple choice, but there are some questions where you need to select more than one correct answer, and the delivery method is a Pearson VUE testing center or online proctored exam which you can take at home. I would say as you take AWS exams, try both and see which works best for you. Alright, let's talk about exam domains and waiting, and this is how this course is structured. We will start the course with domain 1: SDLC automation. Note the weighting of this domain, this is the highest weighted domain, 22%. So 22% of the exam roughly will cover domain 1, and then as we progress through the course, domain 2: configuration management and infrastructure as code, domain 3: resilient cloud solutions, domain 4: monitoring and logging, domain 5: incident and event response, and domain 6: security and compliance, and this is a nice flow to the course, and we'll see as we get down into domain 4, 5, and 6, there's a bit of overlap, but some repetition is good in helping us prepare for the exam and allows us to focus on some really key points which will help us pass the exam. So with that said, we've got a lot of ground to cover, but we're going to learn a lot and prep for this exam and smash this exam, so please join me in the AWS Certified DevOps Engineer Professional Exam Prep course.
